Question

Answer

What is a spectrum in science?

A spectrum is a range of different colors or wavelengths of light that are produced when light is separated, such as through a prism.

How is a rainbow an example of a spectrum?

A rainbow shows a spectrum because sunlight is split into different colors (red, orange, yellow, green, blue, indigo, violet) when it passes through water droplets in the air.

What are the primary colors of light in a spectrum?

The primary colors of light in a spectrum are red, green, and blue, which can combine to create other colors.

How does a prism create a spectrum?

A prism bends (refracts) different wavelengths of light by different amounts, causing the light to spread out into a spectrum of colors.

Why do different colors bend differently in a prism?

Different colors have different wavelengths, and each wavelength bends at a different angle when passing through the prism, causing separation of colors.

What is the visible spectrum?

The visible spectrum is the part of the electromagnetic spectrum that can be seen by the human eye, ranging from red to violet.

How can we use spectra to learn about stars?

Scientists analyze the light spectra from stars to determine their composition, temperature, and movement.

What is the difference

between a continuous

spectrum and a line

spectrum?

A continuous spectrum shows all colors blending smoothly,

while a line spectrum shows only specific colors or lines,

indicating certain elements.

How does light from a

fluorescent bulb produce a

spectrum?

Fluorescent bulbs produce light by exciting gases inside

the bulb, which emit light at specific wavelengths, creating

a line spectrum.
